Introduction

This analysis was carried out to interpret the morphometric analysis data taken from two selected locations at Unilag front and National Theater.

Data Importation and Loading of the Libraries in R programming for Analysis.

Packages used for the analysis include the following packages: Tidyverse, dplyr, car, knitr, ggpubr, readxl and gridextra.

```
## Load the packages for Analysis
```

```
library(tidyverse)
```

```
-- Attaching core tidyverse packages ----- tidyverse 2.0.0 --
```

```
v dplyr 1.1.4 v readr 2.1.5
```

```
v forcats 1.0.0 v stringr 1.5.1
```

```
v ggplot2 3.5.2 v tibble 3.2.1
```

```
v lubridate 1.9.4 v tidyr 1.3.1
```

```
v purrr 1.0.4
```

```
-- Conflicts ----- tidyverse_conflicts() --
```

```
x dplyr::filter() masks stats::filter()
```

```
x dplyr::lag() masks stats::lag()
```

```
i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to become errors
```

```
library(car)
```

Loading required package: carData

Attaching package: 'car'

The following object is masked from 'package:dplyr':

recode

The following object is masked from 'package:purrr':

Test for Normality/Distribution of Data(Morphometric Data) across all sampling stations and sexes

The normality of the water quality parameters were tested across the sampling stations and seasons using Shapiro-Wilk test and K.S Test. Parameters with $P > 0.05$ indicate a normal distribution of the data while parameters with a p value less than 0.05 indicate a non- normal distribution of the data set.

Shapiro-Wilk normality test

data: tw_g[station == "A"]
W = 0.93624, p-value = 0.03886

Shapiro-Wilk normality test

data: tw_g[station == "B"]
W = 0.87361, p-value = 0.0006993

Shapiro-Wilk normality test

data: tw_g[station == "C"]
W = 0.92075, p-value = 0.01324

Shapiro-Wilk normality test

data: tw_g[station == "D"]
W = 0.96641, p-value = 0.3358

Shapiro-Wilk normality test

data: tw_g[station == "E"]
W = 0.97655, p-value = 0.6282

Warning in ks.test.default(cruen_data\$tw_g, "pnorm"): ties should not be present for the one-sample Kolmogorov-Smirnov test

Asymptotic one-sample Kolmogorov-Smirnov test

data: cruen_data\$tw_g
D = 0.99984, p-value < 2.2e-16
alternative hypothesis: two-sided

Warning in ks.test.default(cruen_data\$cw_cm, "pnorm"): ties should not be present for the one-sample Kolmogorov-Smirnov test

Asymptotic one-sample Kolmogorov-Smirnov test

data: cruen_data\$cw_cm
D = 0.99653, p-value < 2.2e-16
alternative hypothesis: two-sided

Warning in ks.test.default(cruen_data\$cl_cm, "pnorm"): ties should not be present for the one-sample Kolmogorov-Smirnov test

Asymptotic one-sample Kolmogorov-Smirnov test

data: cruen_data\$cl_cm
D = 0.9861, p-value < 2.2e-16
alternative hypothesis: two-sided

Table showing the Summary Data of *G. cruentata* by Station, Sex and Season.

`summarise()` has grouped output by 'station'. You can override using the `.groups` argument.

|------|------|
| F | 94 |
| M | 86 |

Regression Analysis of the Length-Weight Relationship of G. cruentata

The regression analysis was conducted to check the relationship between the length and weight relationship of the sampled species. $p < 0.05$ indicate there is a sign difference between the length and weight of the sampled species. $p > 0.05$ indicate that there is no sign difference between the length and weight of the sampled species.

Linear Regression for Combined Sexes

```
## Linear Regression Model for combined sex
lw_model <- lm(cruen_data$log_tw ~ cruen_data$log_cl)

print(coef(lw_model))
```

```
(Intercept) cruen_data$log_cl
-0.4725812    3.0653411
```

```
lw_summary <- lw_model |>
  summary()
## Check p value
lw_summary
```

Call:

```
lm(formula = cruen_data$log_tw ~ cruen_data$log_cl)
```

Residuals:

| Min | 1Q | Median | 3Q | Max |
|----------|----------|----------|---------|---------|
| -0.16220 | -0.04490 | -0.00291 | 0.03415 | 0.31985 |

Coefficients:

| | Estimate | Std. Error | t value | Pr(> t) |
|--------------------|----------|------------|---------|------------|
| (Intercept) | -0.47258 | 0.03532 | -13.38 | <2e-16 *** |
| cruen_data\$log_cl | 3.06534 | 0.06191 | 49.51 | <2e-16 *** |

 Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

Residual standard error: 0.06847 on 177 degrees of freedom

(1 observation deleted due to missingness)

Multiple R-squared: 0.9327, Adjusted R-squared: 0.9323

F-statistic: 2452 on 1 and 177 DF, p-value: < 2.2e-16

Check for either Isometric or Allometric Growth

When the $b > 3$ we assume that there is a positive isometric growth among the sampled species indicating individuals gain weight faster. while when $b < 3$: this indicate negative isometric (individuals gain weight slowly).

```
## Check for Isometric or Allometric growth
b_value <- coef(lw_model)[2] ## Positive Isometric growth (b>3),
## Individual gain weight Faster
b_value |>
  kable()
```

| | x |
|--------------------|----------|
| cruen_data\$log_cl | 3.065341 |

Regression Plot showing the Length and Weight Relationship of the Combined Sexes

Table showing the Number of Males and Female of *G. cruentata*

| Var1 | Freq |
|------|------|
| F | 92 |
| M | 88 |

Regression Analysis of the Length-Weight Relationship of *G. cruentata*

The regression analysis was conducted to check the relationship between the length and weight relationship of the sampled species. $p < 0.05$ indicate there is a sign difference between the length and weight of the sampled species. $p > 0.05$ indicate that there is no sign difference between the length and weight of the sampled species.

Linear Regression for Combined Sexes

```
(Intercept) data_cruen$log_cl  
1.250837e+00 1.980388e-06
```

Call:

```
lm(formula = data_cruen$log_tw ~ data_cruen$log_cl)
```

Residuals:

```
      Min       1Q   Median       3Q      Max  
-0.69084 -0.11084  0.01916  0.21166  0.50916
```

Coefficients:

```
              Estimate Std. Error t value Pr(>|t|)

---
```

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

Residual standard error: 0.2759 on 178 degrees of freedom

Multiple R-squared: 0.001042, Adjusted R-squared: -0.00457

F-statistic: 0.1857 on 1 and 178 DF, p-value: 0.6671

Check for either Isometric or Allometric Growth

When the $b > 3$ we assume that there is a positive isometric growth among the sampled species indicating individuals gain weight faster. while when $b < 3$: this indicate negative isometric (individuals gain weight slowly).

```
## Check for Isometric or Allometric growth  
b_value_2 <- coef(lw_model_2)[2] ## Positive Isometric growth (b>3),  
## Individual gain weight Faster
```

```
b_value_2 |>
  kable()
```

| | x |

| data_cruen\$log_cl | 2e-06 |

Regression Plot showing the Length and Weight Relationship of the Combined Sexes

`geom_smooth()` using formula = 'y ~ x'

Linear Regression of the Length-Weight for Male *G. cruentata*

Check for either Isometric or Allometric Growth

```
## Check for Isometric or Allometric Growth
b_male_2 <- coef(male_model_2)[2]
print(b_male_2) ## Positive Isometric Growth (b>3),
```

```
male_lw_2$log_cl  
3.300717
```

```
## Individual gain weight Faster
```

Linear Regression of the Length-Weight for Male *G. cruentata*

Check for either Isometric or Allometric Growth

```
## Check for Isometric or Allometric Growth  
b_female_2 <- coef(female_model_2)[2]  
b_female_2 |>  
kable()## Negative Isometric Growth (b<3)
```

| | x |
|---------------------|---------|
| female_lw_2\$log_cl | 2.3e-06 |

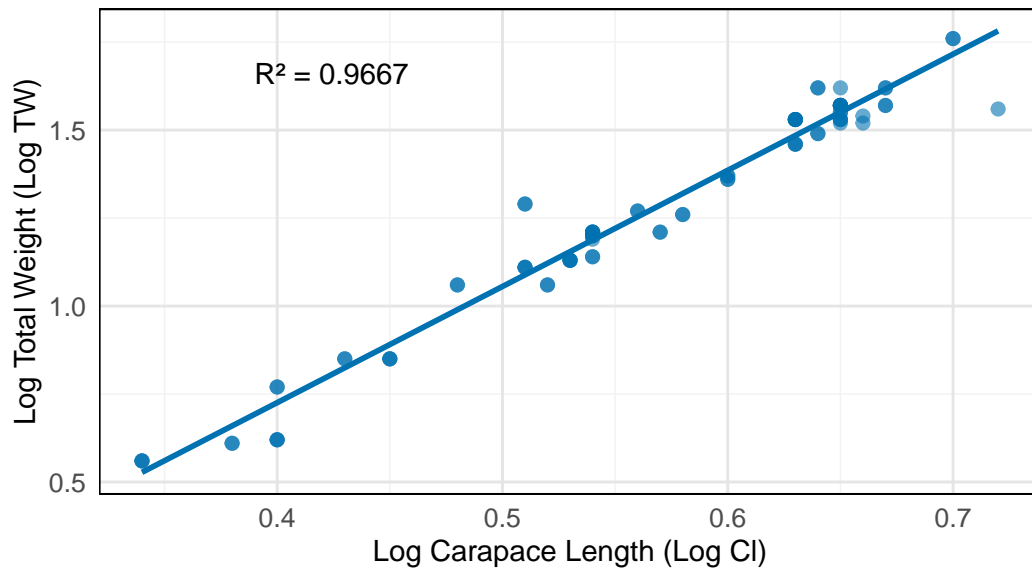

```
## Individual gain weight Slower
```

Regression Plot showing the Length and Weight Relationship of the Male *G. cruentata*

``geom_smooth()`` using formula = 'y ~ x'

Length–Weight Relationship of Male *G. cruentata*

$$\text{Log TW} = -0.5948 + 3.3007 * \text{Log CL}$$

Regression Plot showing the Length and Weight Relationship of the Female *G. cruentata*

`geom_smooth()` using formula = `'y ~ x'`

Test of Homogeneity of Variance for the Morphometric Data across the Sampling Stations.

When $p > 0.05$ we assume the sampled data has equality of variance but when $p < 0.05$ we assume equality of variance was not met.

For *G. cruentata* Length

| | Df | F value | Pr(>F) |
|-------|-----|----------|-----------|
| group | 9 | 2.489116 | 0.0107171 |
| | 170 | NA | NA |

For *G. cruentata* Weight

```
tw_var_2 <- leveneTest(data_cruen$tw_g ~ data_cruen$s_e_x * data_cruen$station)

tw_var_2 |>
  kable()
```
